In Via delle Corse in Merano, **Torggler was founded;** a shop offering building materials and other products such as nails and canned food.	In addition to reselling, Torggler started producing its own **building materials.**	Production of the **first tile adhesive.**	Production of **silicone and acrylic sealants** starts in Merano. In cooperation with Bayer Germany, Torggler R&D develops the first high-performance sealants for various applications.	The **first fast-curing and setting mortar** Umafix is released. The era of special mortars begins in Italy.	**Development and production of Lamiera:** the neutral silicone sealant that will make history in sealing sheet metal.	The **second production plant** in Rieti was opened. Production of powder products and PU foams is expanded.

Hybrid polymer-based products

The term HYBRID has been very much in vogue in recent years because it is linked to new-generation dual-fuel cars, but the concept of HYBRID can be associated with any technology that is born of a ,crossing'.
Hybrid polymer products are based on a scientifically and technically advanced chemical formulation that crosses different sealant formulations.
This ,crossing' makes it possible to retain all the advantages of silicone - e.g. UV resistance and elasticity at all temperatures - while at the same time overcoming its limitations, guaranteeing adhesion even on wet substrates and overpaintability. This is why hybrid products are making their way into the world of traditional adhesives and sealants, gaining, year after year, the reputation they deserve, in construction, industry, automotive and even in the marine industry.

Hybrid polymer-based sealants/adhesives are the most versatile products in our range.
In this modern technology, all the main requirements that professional work demands are met and guaranteed:

Resistance to external stress
and ageing in general

Permanent
elasticity

Adhesion on any
surface, even damp

Overpaintable to satisfy the
most demanding clients

No shrinkage or
disintegration

Solvent- and isocyanate-free
formulation for safer and
more sustainable work

Choosing a hybrid polymer product is never wrong!
In order to choose the most suitable hybrid for our needs, we must evaluate the elastic modulus, i.e. the tensile strength versus elongation of the joint:

- The lower the elastic modulus (LM), the more elastically deformable the joint.
- The higher the elastic modulus (HM), the more structural the joint.

Hybrid LM..
... is suitable for the installation of windows and doors or in prefabrication where a high capacity for elastic movement is required.

Hybrid HM..
... is suitable for strong yet elastic bonding or for joints subject to small movements.

HY 2.0..
... is suitable for bonding where crystal-clear transparency is a must.

Strong..
... is suitable for bonding with an immediate tack effect, i.e. with zero vertical slip.

And finally Sitol® Infinity, the new frontier to the future.
A name, a programme:
Endless possibilities with Sitol® Infinity!

- Infinite adhesive power on any type of substrate, even damp or underwater
- Infinite durability and performance over time, attested by important certifications (IMO MED, ISEGA)
- Infinite the areas in which it can be used: marine, automotive, industry, construction, DIY
- Countless mechanical and chemical properties that make it a structural adhesive resistant to dynamic stresses
